3 days ago; Here are a few tips to identify planets in the night sky: Tip 1: Planets are not visible anywhere in the sky. They are visible along the ecliptic. The ecliptic is the path of the sun across the sky. So notice carefully where the sun rises, along which path it moves during the day and where it sets. Planets are visible along this path at night.

What planet are we in right now

Uranus is visible high in the southwestern sky preceding sunrise on October 22, 2024. It is visible to the right of Jupiter. It rises around a couple of hours after sunset. As Uranus shines at the edge of naked-eye visibility, it is hardly visible to the unaided eye unless you have clear eyesight and a very dark sky.

Now a look at Moon and planet pair-ups for October. On the 13th and 14th after dark, look for the nearly full Moon with Saturn toward the southeast. Then on the evening of October 20th, the Moon rises near Jupiter, with the giant planet looking extremely bright. You should be able to find them low in the east after around 10 pm that night.

Uranus will be visible very close to the full moon on the evening of November 15, 2024. Uranus will be brightest and visible almost all night in our sky in November 2024 as it will reach its opposition on November 17, 2024. At that time, Uranus will be located on the opposite side of the sun on our sky's dome.

Planets Visible Tonight - November 2024. The month of November lets us see all of the planets except Mercury, which is too close to the sun for us to spy. Venus, Jupiter and Saturn are all evening planets, along with the ice worlds of Uranus and Neptune. Mars begins the month firmly as a morning planet but moves to allow decent late evening viewing as December comes into ...
