The second option is to store the cold energy produced by the chiller in a cold storage unit. While the use of hot storage tank in the solar field is an inseparable part of a solar cooling system [6], [70], adding a cold storage unit after the chiller could reduce both the chiller capacity and the mismatch between the supply and demand [85].

from an energy storage medium during periods of low cooling demand, or when surplus renewable energy is available, and then deliver air conditioning or process cooling during high demand ... chillers cools the pipes or tubes during off-peak periods. Warm water-glycol from cooling loads melts the

To determine the load that the chiller will run during the "storage periods", we must remember that we now only have 16 hours per day to run the chiller. During the storage periods, we must make enough "cold storage" (and probably a little more to have a surplus) to "coast" through the peak periods of the day.

Thermal energy storage (TES) is recognized as a well-established technology added to the smart energy systems to support the immediate increase in energy demand, flatten the rapid supply-side changes, and reduce energy costs through an efficient and sustainable integration. ...
